Company Rokobit

Position middle developer

Project description SuperInvoice
The site developed in order to control the business workflow. A user can create 12 various types of documents, with the possibility of use, depending on the business needs. There is an ability to control workflow and debt on each client. Each document is building in PDF format with the possibility of printing any document at any time. Moreover, the system can build a hierarchy of users, depending on the type of authority in business.

Role Back-end developer

Tasks Implemented REST-API and authorization for Api-Key, Created 12 types of documents for conducting document circulation and 7 types of payments to them, depending on the needs of the user. Each document can be linked together, depending on its type. Developed filtering by date of creation, customer, document type, amount and state of the document, open or closed. Created generation for any document in pdf and excel formats. Developed output documents for each client, and output amounts due to customers or users. Integrated system to attract new customers and payment percentage for the client. Built control system of document circulation for a manager for subordinates. Created history records in each of their actions by the user. Integrated system of care in the use of this software. He developed a system of transmission of documents and messages between clients and more.
